One equation then between two unknown quantities admits of an infinite number of solutions; but if we have as many different equations, as there are quantities, the number of solutions will be limited. Thus, while each of the equations  $x = 10-2y$ ,  $4x + 4 = 3y$ , separately considered, is satisfied by an infinite number of pairs of values of  $x$  and  $y$ , there will only be found one pair common to both, viz.  $x = 2$ ,  $y = 4$ , which are therefore the roots of the pair of equations,  $x = 10-2y$ , and  $4x + 4 = 3y$ . Equations of this kind, which are to be satisfied by the same pair or pairs of values of  $x$  and  $y$ , are called simultaneous equations. If there be three unknowns, there must be three equations, and so on: and moreover, these equations must all be different from one another; i. e. must all express different relations between the unknown quantities. Thus, if we had the equation  $x = 10-2y$ , it would be of no use to join with it the equation  $2x = 20-4y$  (which is obtained by merely doubling it), or any other, derived, like this, immediately from the former; since this expresses no new relation between  $x$  and  $y$ , but repeats in another form the same...
